### NOTICE

The above safety instruction tags were permanently affixed to your pump prior to shipment. Do not remove, paint over or obscure in any manner.

Failure to heed these warnings could result in serious bodily injury to the personnel operating and maintaining this equipment.

---

## SAFETY PRECAUTIONS FOR LIQUID RING PUMPS

Please read the following safety information on this page before operating your vacuum pump.

- Do not operate the pump without the coupling and belt guard properly attached. Disconnect the pump motor from the electrical supply at the main disconnect before removing the belt guard. Replace the belt guard before reconnecting the power supply to the pump motor. Operating the pump without the belt guard properly installed exposes personnel in the vicinity of the pump to risk from rotating drive components.

**CAUTION:** Do not operate the pump with oxygen-enriched gas in the suction line, unless the pump has been properly cleaned, inspected and certified to be free of hydrocarbon presence and prepared with an inert fluid suitable for the application.

- Oxygen-enriched gas is defined as gas of which the constituents include by volume (mol. %) an amount of oxygen greater than that of standard atmospheric air (typically 20-21% by volume).
- If the oxygen content in the gas stream exceeds the proportions found in standard atmospheric air, then it is considered an oxygen-enriched gas and standard mineral oil, synthetic hydrocarbon oil or other non-inert fluids should not be used.

**WARNING:** Pumping oxygen-enriched gases with mineral oil, synthetic hydrocarbon oil or other non-inert fluids can cause fire or explosion in the pump, resulting in damage or serious bodily injury or death.

- Take precautions to avoid prolonged or excessive exposure to oil mist or process materials emanating from the discharge of the pump.
- Do not allow the pump to discharge into a closed, or inadequately ventilated room. Always use a discharge oil mist eliminator unless the pump discharge is discharged to outside atmosphere. Laws and ordinances may pertain to your local area regarding discharge of oil mist or vapor to atmosphere. Check local laws and ordinances prior to operation of the pump with discharge to outside atmosphere.
- Venting of the discharge of an oil mist eliminator to outside atmosphere is highly recommended.
- Do not restrict the pump discharge in any way, or place valves in the discharge line. The vacuum pump is a compressor and will generate high pressures without stalling the motor when operated at low suction pressures. **Excessive pressure could cause pump damage or serious bodily injury.**
- Disconnect the pump motor from the electrical supply at the main disconnect before disassembling or servicing the pump. Make sure pump is completely reassembled, the belt guard is properly installed, and that all fill and drain valves are installed and closed before reconnecting the power supply. **Accidental starting or operation of the pump while maintenance is in progress could cause pump damage or serious bodily injury.**
- Lift pump only by the lifting lugs supplied with the pump. DO NOT lift equipment attached to pump by the pump lifting lugs.
- Do not touch hot surfaces on the pump. In normal operation at low pressures, surface temperatures will not normally exceed 180° F (82° C). Prolonged operation at 200 Torr (267 mbar a) may cause surface temperatures as high as 220° F (104° C)

## **INTRODUCTION**

**CONGRATULATIONS** on your purchase of a new AF axial flow liquid ring vacuum pump from Tuthill Vacuum & Blower Systems. Please examine the pump for shipping damage, and if any damage is found, report it immediately to the carrier. If the pump is to be installed at a later date make sure it is stored in a clean and dry location and make sure covers are kept on all openings. If pump is stored outdoors be sure to protect it from weather and corrosion.

AF liquid ring vacuum pumps are built to exacting standards and if properly installed and maintained will provide many years of reliable service. We urge you to take time to read and follow every step of these instructions when installing and maintaining your pump. We have tried to make these instructions as straightforward as possible as we realize getting any new piece of equipment up and running in as little time as possible is imperative to production.

***WARNING: Serious injury can result from operating or repairing this machine without first reading the service manual and taking adequate safety precautions.***

## **LIQUID RING VACUUM PUMPS — PRINCIPLE OF OPERATION**

The liquid ring vacuum pump removes gases by means of an impeller rotating freely in an eccentric casing. The pumping is done by a liquid, usually water, that is fed into the pump and thrown by centrifugal force into a moving ring along the casing or cover wall. When gas or vapor enters the suction port, it is trapped by the whirling impeller blades and a liquid piston that expands in the eccentric lobe of the casing. As the impeller rotates, the liquid is then pushed inward by the narrowing space between rotor and casing, compressing the trapped pocket of gas. Finally the compressed gas is released through a discharge port as the impeller completes the revolution.

The direct contact between the liquid ring and the gas makes the pump ideal for wet applications and for handling condensibles that are discharged with the gas and liquid. Unlike rotary vane and piston pumps, the operation of a liquid ring vacuum pump is nearly isothermal and without vibration. There is no oil to be changed or pollutant released into the environment. Because there are no valves and no rubbing parts, a liquid ring pump is virtually maintenance free.

With liquids other than water, vapor pressure in the pump can be reduced for high vacuum or compatibility achieved with specific process gases. In some cases, distillate or another fluid is introduced directly into the suction pump inlet and used as the liquid seal.

Liquid ring pumps are also commonly staged with positive displacement blowers, air and steam ejectors for greater capacity and/or deeper vacuum. Tuthill Vacuum & Blower Systems offers many such staged units, including its patented AF two-stage system with rotary blower, liquid ring back up and unique fluid coupling design.

## **SPECIAL FEATURES**

One of the distinguishing features on an AF pump is an axial flow design that permits the widest range and highest vacuum of any single-stage liquid ring pump. A fixed port cylinder concentric with the rotor bore directs the gas along the shaft axis, into the suction ports of the rotor, and finally back through the rotor and rear of the pump for discharge.

Because the gas flow is along the motor shaft (and not at right angles), the pump can start in a flooded state without damage and has excellent water handling capacity. The use of a shrouded rotor also increases pumping efficiency for high vacuum and low water consumption. The pump head, close-coupled to a NEMA C-face motor, is extremely compact and requires no interstage manifold as do older style radial flow pumps.

Further advantages to AF pumps include the use of modern O-Rings and mechanical Seals rather than gaskets and stuffing boxes, and a replaceable port cylinder for fast in-the-field repair. Available in all bronze, cast iron, stainless steel and other special materials.

## **SERVICE AND PARTS**

AF pumps are 100% designed and manufactured in the United States. All parts are maintained in inventory for immediate shipment from our factory in Springfield, MO. At the back of this manual is a list of parts and recommendations for spares to keep on hand. The reputation of Tuthill Vacuum & Blower Systems is staked on fast service and practical assistance in designing vacuum systems for specific applications. Specializing in the liquid ring field, the company was created by and for ENGINEERS.

## **SAVE WATER, TIME AND MONEY WITH AF SEALANT RECOVERY SYSTEMS**

In applications where water is costly, scarce or unavailable, AF Sealant Recovery Systems provide simple, compact and environmentally safe options for recirculating seal water and storing waste.

## THE BASIC SYSTEM

The standard configuration for recirculating seal water is to pipe the pump discharge into a small separator tank where non-condensed gas is vented into the atmosphere and the water is returned to the pump inlet. By having a tee connection in the inlet piping for the return (rather than through the separate seal water inlet), the pump will draw its own water requirement controlled by a flow restrictor in the return line.

The basic system offered by Tuthill Vacuum & Blower Systems is a completely self-contained pumping system that fits almost anywhere for intermittent or low vacuum use. The package includes a close-coupled pump, baseplate, and stainless steel separator tank with complete seal water and discharge piping.

## HEAT EXCHANGERS

For continuous high vacuum use, a heat exchanger is recommended to counter the temperature rise from the heat of compression. Higher seal water temperatures will increase the partial vapor pressure inside the pump and limit high vacuum performance. Used in conjunction with water chillers, refrigeration units, fan coils or cooling towers, a properly sized heat exchanger will maintain seal water temperatures for maximum performance.

Depending on the heat to be removed and cooling system available on location, Tuthill Vacuum & Blower Systems will specify or furnish a heat exchanger sized for your application.

## OTHER ALTERNATIVES

Among the other options for reusing liquid sealant are partial recirculation systems and specially packaged units using sealants other than water (i.e. oil, solvents, etc.). In a partial recirculation loop, a certain amount of make-up water is fed into the pump to minimize temperature rise, yet allow for substantial water savings.

For sealants other than water, be sure to consult Tuthill Vacuum & Blower Systems for assistance with both the pump and recirculation sizing.

Tuthill Vacuum & Blower Systems invites you to inquire about specific, practical and inexpensive methods for reducing your operating costs and for saving that precious natural resource - water.

## INSTALLATION

### LOCATION

Because of its close-coupled design, an AF pump is ideal for applications where space is critical. Its vibration-free operation permits direct bolting to the floor or mounting on a baseplate anywhere that is convenient for piping. The standard motors furnished by TUTHILL Vacuum & Blower Systems on AF are Totally Enclosed Fan Cooled (TEFC) suitable for areas where the motor may be exposed to water. Special motors are available for hazardous locations.

The pump needs no adjustment, alignment or coupling, guard, etc., and because the pump runs COOL, no special ventilation is necessary — or access for checking sight glasses and oil. In choosing a location, the main consideration should be the pump's proximity to the vacuum system and convenience for draining discharge and piping the seal water.

Figure 1. AF Axial Flow Design

### GENERAL PIPING INSTRUCTIONS

*The Inlet, Discharge and Seal Water Piping require observance of three basic rules:*

- A. Piping must be free of all welding shot, slag and other foreign matter that could damage pump.
- B. Piping must be supported independently to avoid stress on pump casing.
- C. Piping should be of the same diameter as the pipe connections on pump.

### VACUUM INLET PIPING

Inlet piping is a simple matter of connecting the pump to the vacuum system. Models A5 and T0505 have a 3/4" NPT connection. Models A10, A15, A20, T1505 and T2010 have a 1" NPT connection on their covers for direct piping.

The larger pumps feature flange faces. An inlet check valve is recommended to prevent vacuum loss and backstreaming when the pump shuts down. Avoid using spring loaded valves not designed for vacuum service. An optional vacuum gauge can be mounted between the pump and check valve to measure inlet vacuum.

## DISCHARGE PIPING

Depending on the application, there are a number of ways to handle the discharged liquid and gas. If there are no pollutants, the simplest scheme is to discharge directly into a drain. An AF pump can carry up to a ten-foot discharge head providing the piping from that height is pitched toward a drain or other receptacle. **EXCESSIVE BACK PRESSURE CAN ADVERSELY AFFECT PUMP PERFORMANCE.**

A second method is to run the discharge through a mechanical separator removing water from the gas. Water contaminated by sanitary waste or noxious gas may be recirculated as seal water or discharged into a sanitary sewer or tank. The nature of the contaminant will determine how often recirculated water must be changed.

## SEAL WATER PIPING

Unless liquid is pumped directly through the vacuum inlet connection, most applications require separate piping for seal water to enter the pump. The seal water inlet is located directly below the vacuum inlet on the pump's face.

Water, the most widely used liquid seal, can be piped directly from a tap or recirculated from a discharge separator tank. Be sure to specify if seal liquids other than water are to be used and Tuthill Vacuum & Blower Systems will make recommendations regarding compatibility of materials, power requirements, etc.

*The following accessories are recommended:*

1. **Flow control valve** (see Seal Water Requirements)
2. **Solenoid valve** (to shut off water when pumping stops)
3. **Strainer** (to prevent foreign matter from entering the pump)

For more information about recirculating seal water, consult Tuthill Vacuum & Blower Systems.

## ELECTRICAL CONNECTIONS

Refer to the motor label or conduit box for correct wiring. Most motors are three phase and will be damaged if single phased. De-rating for 50 cycle operation at different voltages is possible if specified on motor label. Otherwise, refer questions to motor manufacturer or to Tuthill Vacuum & Blower Systems.

**NOTE: Be sure to jog motor before starting to insure correct wiring and rotation.**

## OPERATION

### SEAL WATER REQUIREMENTS

AF liquid ring pumps, because of their exclusive axial flow design, have the ability to handle large amounts of water and, unlike radial flow pumps, can start in a flooded state without damage. Seal water flow is not critical and the flow rates can be readily adjusted for a wide variety of applications. *For most applications, the optimum seal water rates are given below:*

The water supply can be regulated by either a flow restrictor or manually by valve. The object is to balance performance against water consumption and power. **THE PUMP MUST NEVER RUN DRY.** The solenoid valve must be in an open position for pumping.

**Figure 2.** Once-through Seal Water  
(minimum pressure 10 PSIG)

**Figure 3.** Recirculated Seal Water  
(Tee into Inlet) — See Page 5 for additional information.

SINGLE STAGE PUMP MODEL	VACUUM RANGE						TWO STAGE PUMP MODEL	VACUUM RANGE ALL RANGES	
	0 - 10" Hg (0 - 340 mbar g)		10 - 25" Hg (340 - 840 mbar g)		> 25" Hg (> 840 mbar g)			GPM	L/min

A300							4.0	15.1	6

## STARTUP

- Once the pump is fully piped and wired for operation, be sure no foreign matter may enter and possibly damage the pump. Check for welding shot, slag or other metal bits.
- Before starting the pump, turn the motor shaft by hand to be sure it is free to rotate. On TEFC motors, you may turn the rear fan. Some resistance during a full rotation is normal.
- If a hard rub is experienced and the motor shaft will not turn, the pump should be checked internally for interference. As long as the shaft can be turned by hand, the pump is operable.
- A final check is to jog the motor, making sure water is introduced into the pump and that rotation is in accordance with the arrow cast on the pump face. If no flow of air or vacuum reading is immediately apparent, rewire the motor accordingly. ROTATION SHOULD BE COUNTER-CLOCKWISE WHEN YOU ARE FACING THE PUMP INLET.
- The pump is now ready for operation.

## STOPPING PUMP

Once the power is shut off, be sure water is stopped from entering the pump. A solenoid valve in the seal water line is recommended to shut off flow simultaneously with cessation of pumping. An inlet check valve is recommended to prevent vacuum loss or back flow to the system.

## MAINTENANCE

As a general rule, maintenance is not required for AF pumps. Because there are no rubbing parts and with water acting as coolant and lubrication during pumping, wear is minimized. It is recommended that the motor bearings be greased periodically in accordance with NEMA recommendations. For further information refer to the *Troubleshooting* section.

To prevent foreign matter from entering the pump, a strainer is recommended for the seal water line and the usual precautions taken in the pump inlet piping.

## TROUBLESHOOTING

### PUMP WILL NOT TURN ON STARTUP

- Check wiring and power to pump.
- Remove pump cover to check for anything that may be binding the rotor. Be sure that the rotor turns freely by hand.
- On cast iron pumps, check for internal rust if pump has been left idle for a long period. Rust can build up to the point where internal clearances are closed. Remove rust and reassemble.
- In areas where there is hard water being fed into the pump, check for scale deposits that may hinder rotation. Scale should be removed by acidizing, but consult the factory for recommended procedures.
- If the motor fails to turn, isolate the motor from the pump and re-check the motor.

### NO PUMPING ON STARTUP

- Check pump rotation. It may be rotating in reverse. Rewire motor to correct.
- Check seal water. Water must be fed continuously into the pump.

## POOR PUMP PERFORMANCE; LOW VACUUM

1. Check vacuum pump while running by sealing off inlet piping and reading vacuum at the pump suction. If high vacuum is achieved, look for leaks in the vacuum system. The pump capacity is a function of high vacuum performance and will conform to the published performance curve at standard conditions. High seal water temperatures will lower the vacuum because of the increase in vapor pressure. Altitude, barometric pressure, and gas temperature can also affect high vacuum performance.
2. If high vacuum is not achieved on blank-off, the problem lies in the vacuum pump. *Poor pump performance can be caused by the following:*
  - a. Pump may not be getting enough water. Adjust water supply and observe for change in the performance.
  - b. Internal parts may be worn. Remove cover/port cylinder assembly and check for wear on the port cylinder, rotor, and cover lands. Most wear will be limited to the port cylinder which should slide easily into the rotor bore. Replace port cylinder if necessary. You may also polish the port cylinder and rotor bore with a fine emery cloth for smooth fit.

## PUMP UNUSUALLY NOISY

1. Unusual continuing noise from the motor end is probably an indication that the motor bearings are bad. Remove cover and spin rotor by hand. You should be able to detect bearing noise. If indicated, replace motor bearings.
2. *Cavitation*. The vacuum pump should not be operated on blank suction for any length of time. When liquid ring vacuum pumps are starved for air, cavitation is indicated by a rattling noise and vibration in the pump. Cavitation can be eliminated by providing a slight air bleed into the vacuum system.

## HIGH AMPS

1. Flooding the pump with too much water, particularly at low vacuum, can overload the motor. Adjust seal water supply.
2. Internal rubbing of rotor with stationary parts can cause excessive loading. Shut off pump and rotate by hand (see *Startup* section) to see if rotor turns freely. Internal rubbing may be due to scale build-up, a galling foreign material or by misalignment of parts. (see *Troubleshooting* section; specifically, paragraphs titled “PUMP WILL NOT TURN ON STARTUP” & “POOR PUMP PERFORMANCE; LOW VACUUM”).

## SERVICE AND REPAIR

AF liquid ring vacuum pumps are designed to minimize down time by allowing for fast in-the-field repair. Time and money-saving features include:

- Shaft mounted assembly for easy alignment and indicating.
- Modern O-rings and mechanical seals for practically zero leakage and easy replacement.
- Replaceable port cylinder that unscrews from cover and requires no special shimming or adjustment.
- Front end disassembly for fast access to major internal parts.
- American-made stock parts available for immediate shipment.

## DISASSEMBLY OF PUMP

The pump may be disassembled while bolted to the baseplate by removing suction and seal water piping and working from cover to motor. *Most repair work will not require full disassembly, but please refer to the exploded pump diagram in following these steps:*

1. Shut off all valves controlling flow of fluids to and from the pump casing. Disconnect external piping.
2. Remove bolts connecting cover to casing. The cover and port cylinder assembly will slide straight outward. The port cylinder is dismantled from cover by removing three socket head cap screws.
3. Remove hex head lock screw and washer from motor shaft. Use a bearing puller to remove rotor without damage to casing. Be sure to protect the threaded shaft bore.
4. Slide shims and mechanical seal off shaft.

Figure 4. Cutaway View

5. Unbolt casing from motor face.
6. Save any and all shims from shaft and casing assemblies for proper realignment.

## ASSEMBLY OF PUMP

Before assembling of the pump, carefully inspect all parts for signs of unusual wear, abrasion and corrosion. O-rings should be checked for cracks or brittleness and the carbon face of the mechanical seal examined for scratches. Replace all parts as needed and proceed as follows. **NOTE: Numbers in parentheses refer to the drawing on page 10.**

### STEP 1 — SLEEVE AND SEAL ASSEMBLY:

The mechanical seal is composed of a seal seat (8a), seal (8b), and spring (8c). The seat is a ceramic ring with a rubber boot that is pressed firmly into the rear of the casing. Lubricant is recommended for ease in inserting rubber boot in the seal housing bore. **BE VERY CAREFUL NOT TO SCRATCH THE CERAMIC FACE DURING HANDLING AND INSERTION.**

Once the seal seat is in place, mount casing (1) on the motor face. The larger pump casings are mounted on four studs extending from motor face, while the smaller casings (Models A5, A10, A15, A20, T0505, T1505, T2010) are secured by four hex head bolts.

It is seldom needed to replace the shaft sleeve. It can usually be polished using fine emery cloth. If the sleeve is to be replaced slip the small O-ring (11) over shaft until it touches the shaft shoulder and place the sleeve/bushing (9) on top so that its chamfered end presses against O-ring.

To complete the assembly, lubricate the sleeve so that the rest of the mechanical seal (#8b) can be pressed on with the carbon face in flat sliding contact with the ceramic seat. Again, **AVOID SCRATCHING OR TOUCHING THE CARBON FACE.** Proper tension between the seal faces is provided by the spring - leading to Step 2.

### STEP 2 — ROTOR ASSEMBLY AND ALIGNMENT:

The rotor is secured to the shaft by means of a key (15), a hex head lock screw (13), and a washer (14). Lower the rotor onto the shaft key, making sure to align the notch with the shaft key. In order for the rotor to turn freely, there must be some clearance between it and the casing. On Models A5, A10, A15, A20, T0505, T1505 and T2010, this clearance is established by adding washer shims (10) until no rub is felt between the back of the rotor and the casing face. On the Models A75, A100, A130, T7530, T10030, shims are used to position the rotor so that the casing face lines up with the inside wall of the rotor shroud. (See photograph below).

**Figure 5. Rotor Assembly**

Be sure to use a bearing puller when removing rotor to add more shims. Avoid damage to the casing face and to the threaded shaft bore. Once secured, the rotor should spin freely without any interference or rub from the casing.

To ensure proper alignment, you may indicate the run-out on the front edge of the rotor. Using a dial indicator measure the run-out on the rotor. It should be within .003 - .005 inches (.08 - .13 mm). Tightening down the rotor is facilitated by using a long bolt and several washers before inserting the lock bolt.

### STEP 3 — PORT CYLINDER ASSEMBLY AND COVER:

The port cylinder (3) is readily mounted on the cover (4) by three socket head cap screws with nylon patches (6). A fiber gasket (5) is used to seal the surface between the cover and port cylinder while the alignment of tapped holes insures correct placement.

The final assembly step is to grease and stretch the O-ring and then insert it into a greased cover groove. Then slide the port cylinder/cover assembly into the rotor bore.

The surface where cover and casing meet will be sealed by the O-ring. In securing the cover to the casing, the cover bolts (19) must be drawn up uniformly. During tightening, the rotor should be turned by hand to insure easy rotation when the pump is fully assembled. Loosen the bolts and then tighten again if a hard rub is experienced.

**NOTE: Models A75, A100 and A130 have two socket head bolts which should be used in the bottom cover holes).**

After the drain plugs (17, 18) have been installed with Teflon® tape on the threads, the vacuum pump is ready for service.

Service Parts can be ordered from our factory in Springfield, Missouri, USA for immediate shipment. All parts for AF pumps are made in USA.

We are happy to assist you with any questions that may arise and to provide advice on applications for your AF pump. Please do not hesitate to contact us.

## **WARRANTY – VACUUM PRODUCTS**

Subject to the terms and conditions hereinafter set forth and set forth in General Terms of Sale, Tuthill Vacuum & Blower Systems (the seller) warrants products and parts of its manufacture, when shipped, and its work (including installation and start-up) when performed, will be of good quality and will be free from defects in material and workmanship. This warranty applies only to Seller's equipment, under use and service in accordance with seller's written instructions, recommendations and ratings for installation, operating, maintenance and service of products, for a period as stated in the table below. Because of varying conditions of installation and operation, all guarantees of performance are subject to plus or minus 5% variation. (Non-standard materials are subject to a plus or minus 10% variation).

THIS WARRANTY EXTENDS ONLY TO BUYER AND/OR ORIGINAL END USER, AND IN NO EVENT SHALL THE SELLER BE LIABLE FOR PROPERTY DAMAGE SUSTAINED BY A PERSON DESIGNATED BY THE LAW OF ANY JURISDICTION AS A THIRD PARTY BENEFICIARY OF THIS WARRANTY OR ANY OTHER WARRANTY HELD TO SURVIVE SELLER'S DISCLAIMER.

<b>Product Type</b>	<b>Warranty Duration</b>
New	15 months after date of shipment or 12 months after initial startup date, whichever occurs first
Repair	6 months after date of shipment or remaining warranty period, whichever is greater
Remanufactured	9 months after date of shipment or 6 months after initial startup date, whichever occurs first

All accessories furnished by Seller but manufactured by others bear only that manufacturer's standard warranty.

All claims for defective products, parts, or work under this warranty must be made in writing immediately upon discovery and, in any event within one (1) year from date of shipment of the applicable item and all claims for defective work must be made in writing immediately upon discovery and in any event within one (1) year from date of completion thereof by Seller. Unless done with prior written consent of Seller, any repairs, alterations or disassembly of Seller's equipment shall void warranty. Installation and transportation costs are not included and defective items must be held for Seller's inspection and returned to Seller's Ex-works point upon request.

THERE ARE NO WARRANTIES, EXPRESSED, IMPLIED OR STATUTORY WHICH EXTEND BEYOND THE DESCRIPTION ON THE FACE HEREOF, INCLUDING WITHOUT LIMITATION, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS OF PURPOSE.

After Buyer's submission of a claim as provided above and its approval, Seller shall at its option either repair or replace its product, part, or work at the original Ex-works point of shipment, or refund an equitable portion of the purchase price.

The products and parts sold hereunder are not warranted for operation with erosive or corrosive material or those which may lead to build up of material within the product supplied, nor those which are incompatible with the materials of construction. The Buyer shall have no claim whatsoever and no product or part shall be deemed to be defective by reason of failure to resist erosive or corrosive action nor for problems resulting from build-up of material within the unit nor for problems due to incompatibility with the materials of construction.

Any improper use, operation beyond capacity, substitution of parts not approved by Seller, or any alteration or repair by others in such manner as in Seller's judgment affects the product materially and adversely shall void this warranty. No employee or representative of Seller other than an Officer of the Company is authorized to change this warranty in any way or grant any other warranty. Any such change by an Officer of the Company must be in writing.

The foregoing is Seller's only obligation and Buyer's only remedy for breach of warranty, and except for gross negligence, willful misconduct and remedies permitted under the General Terms of Sale in the sections on CONTRACT PERFORMANCE, INSPECTION AND ACCEPTANCE and the PATENTS Clause hereof, the foregoing is BUYER'S ONLY REMEDY HEREUNDER BY WAY OF BREACH OF CONTRACT, TORT OR OTHERWISE, WITHOUT REGARD TO WHETHER ANY DEFECT WAS DISCOVERED OR LATENT AT THE TIME OF DELIVERY OF THE PRODUCT OR WORK. In no event shall Buyer be entitled to incidental or consequential damages. Any action for breach of this agreement must commence within one (1) year after the cause of action has occurred.

February, 2008
